# Felix Andersson

**Senior Fullstack Engineer,** *building products people can trust.*

Nearly six years shipping software other teams depend on: Cisco's Magnetic design system and the Meraki Dashboard's most used pages, and now the whole stack of Clayful, a student mental-health platform: Rails and Node services, auth, third-party integrations, data pipelines and a mobile app. I own problems from the incident to the fix, with the evidence that it worked. I also design and build products of my own, end to end.

## What I bring

- **Fullstack ownership** — Rails and Node services, auth, integrations, a mobile app.
- **Production debugging** — Incidents traced through logs and data to a measured fix.
- **Complex UI** — Design systems, data-heavy dashboards, large tables.
- **AI-native tooling** — Review pipelines and agent skills teams run every day.

## Experience

Montevideo, through GoGrow and Vairix

**Oct 2026 – Present** · Client: Clayful

### Fullstack Engineer — NOW

**Clayful**, student mental-health platform · through GoGrow

The whole stack: Rails API, Firebase Cloud Functions, a Capacitor app and the Webflow site, wired to Salesforce and Zendesk.

- Traced classroom-wide logouts to the auth vendor's per-IP rate limit (Sentry against Cloud Run logs) and made the start-of-class burst **~4× smaller**.
- Ended 401s on valid logins in the serverless API: JWKS cached per instance with a bundled fallback.
- Rails jobs (Solid Queue) that respect third-party rate limits, after the noise had Sentry dropping **97%** of the API's errors.
- Support-chat identity redesigned across web, mobile and API (server-side JWT signing, ADRs); Salesforce backfills with dry runs and reverts; PII-safe Sentry.

**Nov 2023 – Sep 2026** · Client: Cisco

### Frontend Product Engineer

**Cisco**, Magnetic component library

The proactive maintainer of the React and TypeScript library that Meraki teams build on. When leadership needs something, I take it from spec to release.

- Non-blocking filtering for data tables with **100k+ rows**: the filter runs in short slices that yield to the browser, so typing stays at **60 FPS** and matches render as they arrive.
- The team's **AI engineering stack**: an AGENTS.md, coding skills, and a pre-push hook with a breaking-change scanner and five specialized reviewers. The team still runs it on every push.
- Support and mentorship for the hundreds of developers who adopt the library, and the code review standards that keep it stable.

## Experience, earlier

Aug 2022 – Nov 2023
Client: Cisco Meraki

### Frontend Engineer, Product Implementation

**Cisco Meraki**, Meraki Dashboard

- Built the Dashboard's most used data pages (Access Points, Switches, Clients): tables with filtering, sorting and export, tuned for the largest customers' datasets.
- Planned and broke down critical features so several developers could build them in parallel, and moved teams from legacy UI to Magnetic.

Aug 2021 – Jul 2022
Client: Cisco

### Frontend Engineer, Design System

**Cisco**, Magnetic design system

- Joined Magnetic at its first components and helped take it to its first production release: accessible React components built to spec.

Dec 2020 – May 2021
Client: Device Magic

### Frontend Engineer

**Device Magic**

My first product. I took full ownership of the web frontend after the senior developer left, and took it to its MVP launch.

- A dynamic forms engine: unlimited nested blocks, recursive state and real-time expression evaluation.
- Large forms made **orders of magnitude faster** by reworking the algorithms and the rendering.

## Recent personal products

A few examples, each designed and built solo, end to end.

### KatArch

Case study ↗

An interactive course that replays, decision by decision, how the winning team of O'Reilly's Fall 2020 Architecture Kata designed their system.

Astro, React islands, Motion · 49 animated diagram scenes

### KnowGraph

Case study ↗

Senior React and Rails interview prep as a map of 142 concepts, each studied with an AI mentor that grades your explanation.

React 19, Node gateway, server-sent events · 146 commits, 10 ADRs, 33 Playwright tests

### PlaySync

Case study ↗

Same video, same second, from two different time zones. Create a room, share a code, and watch YouTube together while you chat.

React 19, Node and WebSockets · drift correction

### LifeUI

Case study ↗

A HUD for real life: plan the day in time blocks, run one activity at a time, and close each one with a single honest moment.

React, Radix UI, Tailwind tokens · 257 tests (Jest and Cypress), CI on every push

### LOL IMPACT

Case study ↗

Which lane moved your League game, minute by minute, and how sure the model can be about it.

Svelte 5, Python and FastAPI, scikit-learn · six per-minute models, intervals on every number, no ML runtime in production

## Toolset

| | |
|---|---|
| Every day | TypeScript, React, Node, Rails, SQL, Git |
| Backend | PostgreSQL, Solid Queue, Firebase, FastAPI, JWT |
| Integrations | Salesforce, Zendesk, GCP, Kamal, Sentry |
| Frontend | Astro, Svelte, Next.js, Capacitor, Tailwind |
| Testing | RSpec, Jest, Playwright, Cypress |
| AI | Claude Code, Codex, agent skills, review pipelines |

## How I got here

**8–9** YEARS OLD — when I found Scratch, MIT's programming language for kids.

**300k+** PAGE VIEWS — on my site of offline flash games, from other kids.

**2×** TOP TEN — in ANIMATE, Uruguay's national animation contest.

I still care most about the same thing: *software people can trust.*
