

Felix Andersson

Senior Frontend Engineer, *building interfaces people can trust.*

Nearly six years building frontend infrastructure other teams depend on: Cisco's Magnetic design system, the React component library behind the Meraki Dashboard, and the Dashboard's most used pages. I enjoy complex, data-heavy UIs and performance work most, and I own problems from spec to release. Lately I've also been designing and building products of my own, end to end.

What I bring

● Design systems

React and TypeScript components every Meraki team builds on.

● Complex UI

Data-heavy dashboards, large tables, deeply nested forms.

● Ownership

A startup's whole frontend, OKR epics, problem to release.

● AI-native tooling

The review pipeline my team runs on every push.

Experience

All through Vairix, Montevideo

Nov 2023 – Present

Client: Cisco

● Frontend Product Engineer NOW

Cisco, Magnetic component library

The proactive maintainer of the React and TypeScript library that Meraki teams build on. When leadership needs something, I take it from spec to release.

- Non-blocking filtering for data tables with **100k+ rows**: the filter runs in short slices that yield to the browser, so typing stays at **60 FPS** and matches render as they arrive.
- Complex, pixel-perfect data table features built to detailed design specs, the most demanding components in the library.
- The team's **AI engineering stack**, built in two to three months when AI adoption became an OKR: an AGENTS.md, coding skills with explicit boundaries, and a pre-push hook that runs a breaking-change scanner (designed from every hotfix and revert in the repo's history) and a review orchestrator with five specialized reviewers. The team still runs it on every push.
- Support and mentorship for the hundreds of developers who adopt the library, and the code review standards that keep it stable.

Aug 2022 – Nov 2023

Client: Cisco Meraki

● Frontend Engineer, Product Implementation

Cisco Meraki, Meraki Dashboard

- Built the Dashboard's most used data pages (Access Points, Switches, Clients): tables with filtering, sorting and export, tuned for the largest customers' datasets.
- Worked with Cisco's design team to build and evolve Magnetic, keeping the experience consistent and accessible across the product.
- Planned and broke down critical features so several developers could build them in parallel.
- Moved teams from legacy UI components to Magnetic while keeping what they had working.

Experience, earlier

Aug 2021 – Jul 2022
Client: Cisco

Frontend Engineer, Design System

Cisco, Magnetic design system

Joined Magnetic while it had its first components and helped take it to its first production release.

- Reusable React components with accessibility and performance as the bar, not an afterthought.
- Detailed design specs turned into components, working directly with the design team.
- Testing and QA for the library's first production release.

Dec 2020 – May 2021
Client: Device Magic

Frontend Engineer

Device Magic

My first product. I took full ownership of the web frontend after the senior developer left, and took it to its MVP launch.

- A dynamic forms engine: unlimited nested blocks, recursive state and real-time expression evaluation.
- Large forms made **orders of magnitude faster** by reworking the algorithms and the rendering.
- When the backend switched to an incompatible XML format, a client-side adapter that translated it on the fly instead of a rewrite.
- The UI for a webcam barcode scanner: a focused scan area with real-time visual feedback.

Recent personal products

A few examples, each designed and built solo, end to end.

KatArch

Case study ↗

An interactive course that replays, decision by decision, how the winning team of O'Reilly's Fall 2020 Architecture Kata designed their system.

Astro, React islands, Motion · 6 chapters, ~80 steps, 49 animated diagram scenes

KnowGraph

Case study ↗

Senior React and Rails interview prep as a map of 142 concepts, each studied with an AI mentor that grades your explanation.

React 19, Node gateway, server-sent events · 146 commits, 10 ADRs, 33 Playwright tests

PlaySync

Case study ↗

Same video, same second, from two different time zones. Create a room, share a code, and watch YouTube together while you chat.

React 19, Node and WebSockets · server-owned clock, drift correction, no database

LifeUI

Case study ↗

A HUD for real life: plan the day in time blocks, run one activity at a time, and close each one with a single honest moment.

React, Radix UI, Tailwind tokens · 257 tests (Jest and Cypress), CI on every push

LOL IMPACT

Case study ↗

Which lane moved your League game, minute by minute, and how sure the model can be about it.

Svelte 5, Python and FastAPI, scikit-learn · six per-minute models, intervals on every number, no ML runtime in production

Toolset

Every day

React, TypeScript, CSS and HTML, design systems, accessibility, performance, Git

Also shipped with

Astro, Svelte 5, Vite, Radix UI, Tailwind, Motion, SVG data visualization

Testing

Jest, Testing Library, Playwright, Cypress, axe-core

Server side

Node, WebSockets, Python and FastAPI, React on Ruby on Rails backends

AI in the loop

Claude Code, Codex, Cursor, agent skills and review pipelines, streaming LLM output

How I got here

8–9

YEARS OLD

when I found Scratch, MIT's programming language for kids.

300k+
